If $a=d=i$, or $=i$, (in which case the primals are parassals art. 38. iii.), and we continue to use the term orthal to express the relation of the rayals, we shall find that any paras sal is or thai to itself (explaining the anomaly that either imaginary asymptote to a circle is perpendicular to itself). If $a=0$, or one rayal is parabscissal, A becomes solitary, and the corresponding rayal is parordinal; that is, retaining the term orthal, parabscissals and parordinals are mutually orthal (vi.), as in the usual Cartesian case of rectangular coordinates. 40. Distals, or Pinchers Coordinates generalised.--(i.) Let (xy) be any stigmal and (xp) its co-stigmal on the primal $p--(ai) x = b$, (fig. 27 gives a Cartesian case,) then $yp=y + (a--i)x--b$, and $y--p$ is called the ordinar distal (distance + al), or simply the distal of the stigmal (xy) from pri $(A, 6b)$. It is evident that $y--p z=z o$ may be used as the equation to that primal. (ii.) Draw pri (T, xy) cutting pri (A, xp) in $(xipx)$; then, as $(Xipi)$ is the stinnal of these two primals, we have (by art. 39. iv.) $Pi--y izzl px--p a--V$ whence $y--pl =-f-$. $(y-/) =-. y + (ai) x--b$; and $y--pi$ is called the general or T-distal of Yfrom the primal (A, ob) , because T is the direction point of the primal which determines it. The usual...
